Attn: David Karavitz

E\$\$ Canada Inc.

David:

AP Plasman has been approached many times with "so called" energy saving devices.

We found David to be more than willing to conduct testing to prove the equipment would enhance our efficiency due to saving money through saving energy. He conducted the proper before and after testing with results showing in excess above the guaranteed 10% savings.

We therefore started purchasing the Circuit Master, an energy saving device supplied by E\$\$ Canada Inc. on a per month basis for the past 4 years. These devices have been installed on our air compressors, exhaust fan motors, vacuum pump motors and our plastic injection molding machines. The follow-up post installation tests that were conducted showed an ROI of less than 1 year. We are planning to have installation of Circuit Master's on all of our injection mold machines.

In addition, the heat reduction due to the lowering of the amp draw is an important factor as it contributes to reduced maintenance costs and longevity of the motor.

We are pleased with this technology to save energy reduce operating costs

We also have purchased and installed the Power Patrol device that is a lightning certified Transient Voltage Surge Suppressor to eliminate/minimize surges and spikes from entering our facility that could result in equipment damage.

I would not hesitate to recommend these products and Mr. Karavitz's professionalism .

Respectively yours,

Curtis Ferguson

Production Manager
